

July 11, 2011

The Honorable Harold Rogers Chairman, House Appropriations H-307, U.S. Capitol Washington, DC 20515 The Honorable Norman Dicks Ranking Member, House Appropriations 1016 Longworth House Office Building Washington, DC 20515

Dear Chairman Rogers & Ranking Member Dicks,

As representatives of U.S. science, engineering, and higher education organizations, we write to you in strong support for the federal research and development budget of the National Science Foundation (NSF), and its mission—created over 60 years ago—to advance research across a broad spectrum of disciplines, research that has fueled American economic growth for decades.

NSF is unique among federal agencies in that it supports **all** disciplines in a balanced portfolio that uses the scientific peer review system as the foundation for awarding research grants based on merit.

Unfortunately, NSF research is now being threatened by attempts to trivialize specific research grants and to challenge the scientific merit review process. As you prepare to debate the Commerce, Justice and Science appropriations bill for fiscal year 2012, the undersigned organizations stand in strong opposition to legislative attempts to undermine the peer review process by seeking to defund research grants that have already been awarded after extensive evaluation by independent scientific review panels.

Furthermore, we strongly oppose attempts to eliminate or substantially reduce funding for specific areas of science such as the NSF Directorate for Social, Behavioral, and Economic Sciences (SBE).

In 2006, Alan Leshner, CEO of the American Association for the Advancement of Science, testified before the Senate in support of NSF SBE research: "Every major issue facing modern society and every major issue facing our economic competitiveness will ultimately be multidisciplinary in nature...[requiring] the integration of the physical sciences or biological sciences with the social and behavioral sciences."

We would like to highlight some specific examples that demonstrate the interdependence of scientific fields and their contribution to society. The revolution in computer technology and the transformation of analog data into digital records are opening up new opportunities to bridge the biological and social sciences, leading to new partnerships and collaborations that will improve the interpretation of brain imaging. In addition, this country will be investing millions of dollars in new technology over the coming decade, and the technology must be designed with humans in mind (i.e., cognitive limitations, errors in judgment, responses to stress and organizational climate) to avoid wasting limited resources.

Furthermore, social scientists, working with computer scientists, have developed Geographical Information Systems (GIS). As an example of technology transfer, this in turn created a multibillion dollar GIS industry. The research supported in the mid-1980s at the NSF-funded National Center for Geographic Information and Analysis (NCGIA) has been applied by states, counties, and localities for many purposes, from urban planning to disaster response, evidenced in New York City during the September 11, 2001, attacks and the creation of thousands of maps to assist in the aftermath. Simply put, we need all scientists and scientific disciplines working — alone and together — to advance our knowledge base.

We recognize the challenge that our nation faces in addressing the deficit and revitalizing our national economy; however, defunding specific grants or eliminating entire sets of disciplines, such as those represented by the SBE program, sets a dangerous precedent that, in the end, will inhibit scientific progress and our international competitiveness. Congress must exercise its oversight responsibilities, but second-guessing the scientific process could have a chilling effect on scientists and young people considering a future in science. The country cannot afford to lose the incredible talent, experience, and energies of its scientists, regardless of their discipline.

The undersigned organizations urge you to protect the integrity of the scientific enterprise by ensuring that the NSF and its independent scientific panels determine where the best scientific opportunities are and how to absorb any potential reductions to its budget. Allocating federal investments competitively through scientific merit review is the very process that has led this country to be the world leader in science. We encourage you to provide Congressional oversight by protecting that process rather than allowing others to threaten a critical contributor to our innovative spirit and knowledge base.

Sincerely,
