

April 19, 2021

The Honorable Jeanne Shaheen Chair Subcommittee on Commerce, Justice, Science, and Related Agencies U.S. Senate Committee on Appropriations Washington, D.C. 20510 The Honorable Jerry Moran Ranking Member Subcommittee on Commerce, Justice, Science, and Related Agencies U.S. Senate Committee on Appropriations Washington, D.C. 20510

Dear Chair Shaheen and Ranking Member Moran,

As the Subcommittee begins deliberations on the Fiscal Year 2022 Commerce, Justice, Science, and Related Agencies Appropriations bill, the Coalition for National Science Funding writes to respectfully request that the National Science Foundation (NSF) receive an appropriation of **at least \$10 billion** in FY 2022. We are an alliance of over 140 professional organizations, universities, and businesses, who are united by a concern for the future vitality of the national science, mathematics, and engineering enterprise of the United States.

We encourage Congress to make bold investments in the NSF this year, setting the agency on a course to advance domestic innovation and to keep pace with investments other countries are making in research and development. According to the National Science Board's (NSB) 2020 Science and Engineering Indicators, "where once the U.S. was the uncontested leader in science and engineering, we are now playing a less dominant role." The United States was the largest R&D performer in 2017, followed by China. However, as the NSB report notes, "Asian countries, most notably China, have heavily contributed to the overall increase in worldwide R&D expenditures, with China accounting for almost one-third, or 32 percent, of the total global growth between 2000 and 2017." At the same time, the U.S. accounted for 20 percent of growth. If we want to remain at the forefront of scientific discovery and continue leading the world in science and engineering and reclaim our role as the "uncontested leader," we must invest strategically and robustly now.

There is bipartisan support for dramatically increasing funding for NSF. For example, in the fiscal year 2021 National Defense Authorization Act, conferees stated in their report that "the NSF is critical to the expansion of the frontiers of scientific knowledge and advancing American technological leadership in key technologies...to achieve its mission in the face of rising challenges from strategic competitors, the NSF should receive a significant increase in funding."

In addition to addressing global competition, NSF needs additional resources to support highquality research and education proposals that are submitted each year but cannot be

funded. Every year, NSF declines thousands of research ideas, and nearly \$3 billion worth of those proposals are rated very good but declined due to inadequate resources.

It is also essential for the United States to invest in NSF's education research and workforce programs, including K-12 STEM education, undergraduate and graduate education and training, broadening participation, and informal education programs. These programs are essential to countering the dual-pronged concerns that international competitors are recruiting U.S. educated talent and more effectively developing their own STEM workforces. For the United States to remain a global leader in scientific research, engineering, and technology development, the nation must provide greater investment in its people, including women and individuals from other groups traditionally underrepresented in STEM fields.

NSF is also playing an integral role in our nation's response to and recovery from the coronavirus pandemic. Agency-funded researchers are improving our understanding of the virus; developing predictions of its spread; and mitigating its impacts on public health, society, and the economy. NSF investments – made over decades – in numerous technologies are being deployed now to fight the coronavirus. For example, advances in artificial intelligence and big data allow researchers to map the spread of the coronavirus and share data with healthcare professionals, state and local leaders, and the public. NSF-supported research in molecular biology and microscopy contributed to the development of COVID vaccines. NSF engineering, social and behavioral science work underpins our vaccine delivery technology and public understanding of risk. As NSF supports 25 percent of all federally funded academic fundamental research at our nation's colleges and universities, the agency will play a key role in rebuilding our economy after the pandemic and ensure that we are better prepared for the next public health crisis.

Finally, CNSF encourages consideration of additional support for NSF's scientific facilities, research infrastructure, and workforce development. NSF's facilities are the bedrock of many scientific disciplines, including the construction of groundbreaking telescopes, delivering the future of high-performance computing infrastructure, and pioneering fundamental physics experiments. NSF could also play a significant role, as it did in previous economic recovery periods, in investing in academic research facilities modernization.

For these reasons, we respectfully request your support to ensure that the National Science Foundation receives at least \$10 billion for FY2022. Thank you for considering our views. Please do not hesitate to let us know how CNSF can be a resource as you move forward with the appropriations process.

Sincerely, The Coalition of National Science Funding

cc: Chair Cartwright and Ranking Member Aderholt
